Impacts on Outcomes
○○○○○

Conclusion
○

Motivation

- Parents' choices govern the success of school choice initiatives
 - In a variety of settings, without additional information, consumers tend not to always respond to quality variation
(Abaluck et al. 2021; Ainsworth et al. 2023)
 - In education markets, it's not obvious that parents should only care about school effectiveness
(MacLeod and Urquiola 2019, Beurmann et al. 2023;)
 - Evidence is mixed about parents' valuation of school effectiveness
(Rothstein 2006; Abdulkadiroğlu et al. 2020, Beurmann et al. 2023; Campos and Kearns 2022)

Impacts on Outcomes
○○○○○

Conclusion
○

Motivation

- Parents' choices govern the success of school choice initiatives
- Imperfect information makes it challenging to infer preferences from observed choices
 - A large body of evidence suggests information disparities loom large
(Hastings and Weinstein 2008; Andrabi et al. 2017; Corcoran et al. 2018; Ainsworth et al. 2023)
 - Imperfect information introduces identification challenges
(Abaluck, Compiani, and Zhang 2022)
 - **Open Question:** What do parents value?

Motivation

Conclusion
○

Motivation

- Parents' choices govern the success of school choice initiatives
- Imperfect information makes it challenging to infer preferences from observed choices
- We know very little about what parents actually know
 - Are they aware of school and peer quality?
 - Are their beliefs biased?
 - **Open Question:** What do parents know?

Motivation

Discrete Choice Evidence
○○○○○○

Impacts on Outcomes
○○○○○

Conclusion
○

Motivation

- Parents' choices govern the success of school choice initiatives
- Imperfect information makes it challenging to infer preferences from observed choices
- We know very little about what parents actually know
- We know even less about factors mediating choices and their implications
 - Social interactions are important for learning, engagement with information, and subsequent choices
(Conley and Udry 2010; Cai, De Janvry, and Sadoulet 2015; Banerjee et al. 2021, Cohodes et al. 2022)
 - Social interactions and networks potentially mediate enrollment-based school quality gaps
(Hahm and Park 2023)
 - **Newer Question:** How important are social interactions in the school choice process?

Motivation

Conclusion
○

Motivation

- Parents' choices govern the success of school choice initiatives
- Imperfect information makes it challenging to infer preferences from observed choices
- We know very little about what parents actually know
- We know even less about factors mediating choices and their implications
- **This paper:** Jointly study how information, preferences, and social interactions shape choices in education markets and provide evidence on these open questions

Motivation
●●○○○

○○○○○

Experiment Design
○○○○○○○○

Reduced Form Evidence
○○○○○

Survey Evidence
○○○○

Discrete Choice Evidence
○○○○○

Impacts on Outcomes
○○○○○

Conclusion
○

This paper

- I organize the questions and objectives around four themes
 1. **What parents know:** What are parents' beliefs about school and peer quality?
 2. **What parents value:** What do parents value when informed about *both* peer and school quality?
 3. **Factors mediating choices:** Do social interactions matter in the school choice process?
 4. **Information campaign mechanisms:** How do information interventions work? Can we differentiate between a salience and information channel?

This paper

- I organize the questions and objectives around four themes
 1. **What parents know:** What are parents' beliefs about school and peer quality?
 2. **What parents value:** What do parents value when informed about *both* peer and school quality?
 3. **Factors mediating choices:** Do social interactions matter in the school choice process?
 4. **Information campaign mechanisms:** How do information interventions work? Can we differentiate between a salience and information channel?
- Setting: Los Angeles
 - 106 middle schools feed into Zones of Choice (ZOC) markets
 - ~23,000 students part of the experimental sample
 - Two experimental waves, 2019 and 2021

This paper

- I organize the questions and objectives around four themes
 1. **What parents know:** What are parents' beliefs about school and peer quality?
 2. **What parents value:** What do parents value when informed about *both* peer and school quality?
 3. **Factors mediating choices:** Do social interactions matter in the school choice process?
 4. **Information campaign mechanisms:** How do information interventions work? Can we differentiate between a salience and information channel?
- Setting: Los Angeles
- Design: Information provision experiment with a few additional features
 - Elicit beliefs about peer and school quality at baseline
 - Distribute information about peer quality and school quality
 - Spillover design allows us to infer the empirical relevance of social interactions

Preview of Results

What parents know

1. Parents tend to underestimate school quality and overestimate peer quality
2. Substantial variation in school and peer quality bias

What parents value and mechanisms

3. Parents systematically shift their choices toward more effective (higher VA) schools in response to treatment
4. Decomposition: Salience impacts account for most of the changes in choices

Evidence of Social Interactions Shaping Demand

5. Indirectly treated families respond in the same way as treated parents
6. Effects are similar at the mean and across the distribution

Impacts on Outcomes

7. Non-cognitive outcomes improve ($0.04\text{-}0.09\sigma$ increase on a variety of indices)
8. Cognitive outcomes (test scores) do not improve

Conclusion
○

Setting: Zones of Choice

- ZOC is a neighborhood-based public school choice program
- Sixteen mutually exclusive high school markets within Los Angeles
 - Parents' choice sets are fixed and specific to their neighborhood
 - Schools and neighborhoods are segregated in terms of race/ethnicity and SES
- Students apply to high schools in the Fall of Grade 8
 - Middle schools feed into particular markets
 - Students enrolled in feeder middle schools in 2019 and 2021 are the experimental sample
 - Families are required to rank all options in their zone of choice in their application

ZOC and Non-ZOC Student Differences

- ZOC Achievement Gap: 0.22σ
- Hispanic Share: 0.90
- Poverty Share: 0.94
- College Graduate Share: 0.12
- ZOC students represent roughly 30-40 percent of LAUSD high school students

Conclusion
o

Baseline Survey

Survey Goals:

- Collect information on parents' school and peer quality beliefs
- Collect a pre-intervention rank-ordered list

Challenges:

1. How do you define school and peer quality? ▶ Details

Researcher definition of school and peer quality:

- School quality is estimated school value-added
- Peer quality is analogous to school average test scores
- School quality validated using lotteries (Angrist et al. 2017)

Definition for parents:

- School quality is referred to as Achievement Growth (AG)
- Peer quality is referred to as Incoming Achievement (IA)

Motivation

Conclusion
o

Baseline Survey

Survey Goals:

- Collect information on parents' school and peer quality beliefs
- Collect a pre-intervention rank-ordered list

Challenges:

1. How do you define school and peer quality? ▶ Details
2. Many degrees of freedom in eliciting beliefs

- Ask parents to assess where schools in their choice set rank across all other schools in the district
- For example: For AG (or IA), is School A in the Top 10%, 80-90%, ...?
- I collect beliefs about the decile parents think their schools belong to

Baseline Survey

Survey Goals:

- Collect information on parents' school and peer quality beliefs
- Collect a pre-intervention rank-ordered list

Challenges:

1. How do you define school and peer quality? ▶ Details
2. Many degrees of freedom in eliciting beliefs
3. Explaining the difference between test score value-added and test score levels is challenging. What I do:
 - Survey includes a video that helps explain the differences between school and peer quality
 - Use visual aids to explain the differences

Conclusion
○

Survey Evidence

- Survey evidence for the 2021 cohort
- Response rate is roughly 50 percent

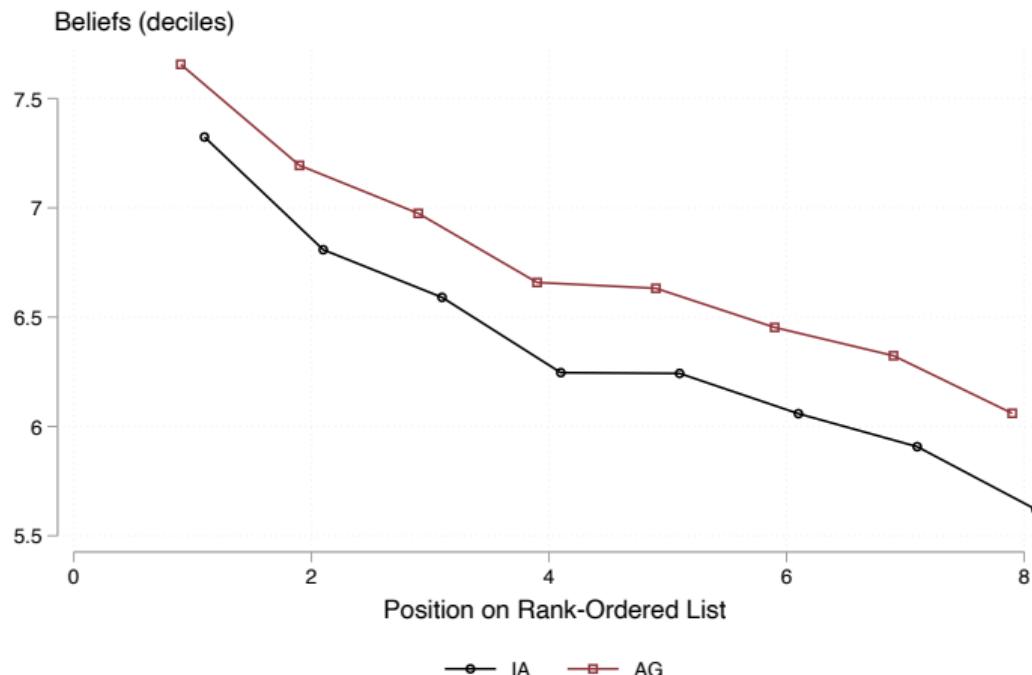

Today:

- Beliefs elicited in decile units
- Bias defined terms of pessimism (in decile units)
- Parent i 's bias for attribute x at school j is:

$$b_{ji}^x \equiv Q_j^x - \tilde{Q}_{ji}^x \quad x \in \{IA, AG\}$$

with Q_j^x referring to researcher-generated quality and \tilde{Q}_{ji}^x referring to beliefs

Beliefs by Position of the Rank-Ordered List

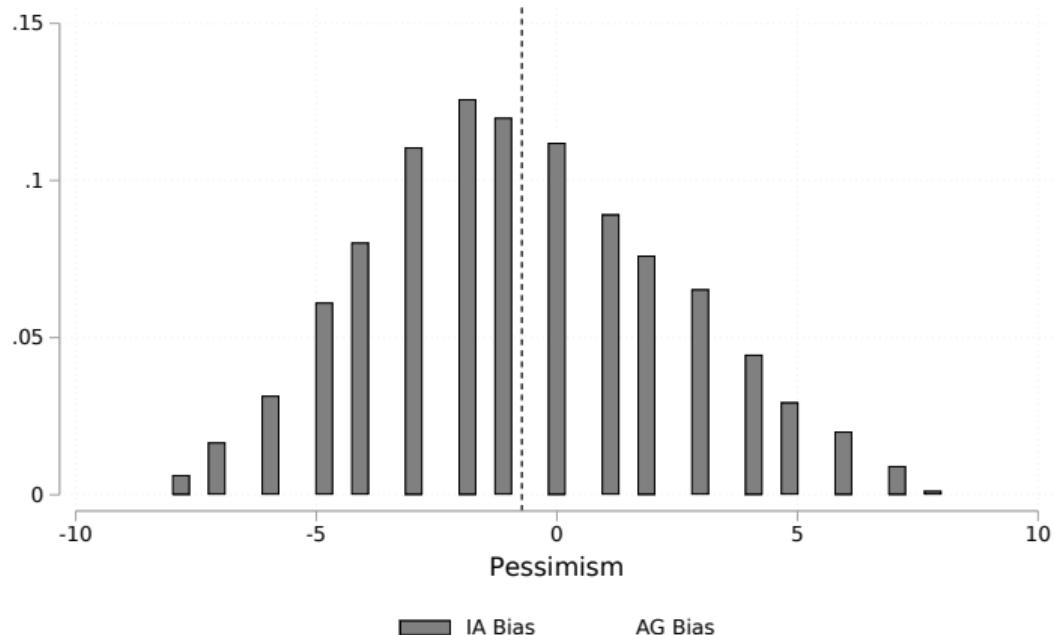

- Parents tend to think their schools have higher AG rankings than IA rankings; this is true
- Parents tend to think schools in their choice set are above average in terms of IA and AG; this is not always true for IA
- A steep gradient in beliefs moving down the ROL is indicative of signal in beliefs

ooooConclusion
○

IA and AG Bias Distribution

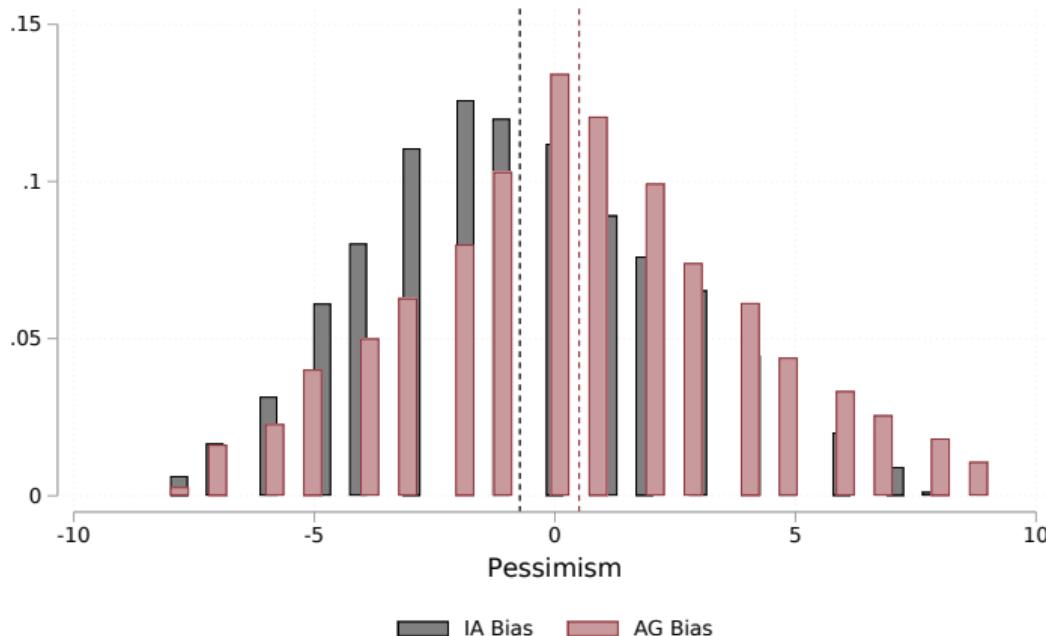

Fraction

- Parents tend to overestimate IA by roughly 0.7 deciles
- IA overestimated by roughly 14 percent on average ($SD=0.46$)

IA and AG Bias Distribution

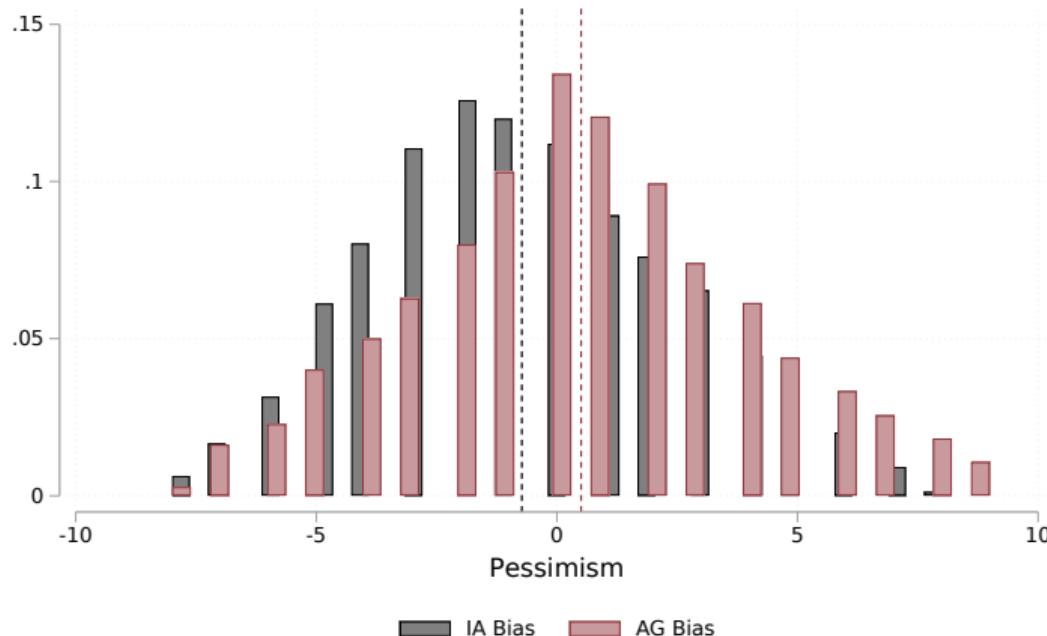

Fraction

- Parents tend to overestimate IA by roughly 0.7 deciles
- IA overestimated by roughly 14 percent on average ($SD=0.46$)
- Parents tend to underestimate AG by roughly 0.5 deciles
- AG underestimated by roughly 2 percent on average ($SD=0.34$)

IA and AG Bias Distribution

Fraction

- Parents tend to overestimate IA by roughly 0.7 deciles
- IA overestimated by roughly 14 percent on average ($SD=0.46$)
- Parents tend to underestimate AG by roughly 0.5 deciles
- AG underestimated by roughly 2 percent on average ($SD=0.34$)
- Biases are choice relevant

The Information Campaign Viewed Through a Discrete Choice Lens

Student i 's indirect utility of being assigned school j is

$$U_{ij} = \gamma_P Q_j^P + \gamma_S Q_j^S - \lambda d_{ij} + \varepsilon_{ij}$$

- Q_j^P, Q_j^S : peer and school quality, respectively
- d_{ij} : distance to school j for parent i
- ε_{ij} : unobserved preference heterogeneity

- $E[MWTT_{i0}^P] \equiv \frac{\gamma_P}{\lambda}$: marginal willingness to travel for peer quality among pure control group
- $E[\Delta MWTT_{iP}^P] \equiv E[MWTT_{iP}^P] - E[MWTT_{i0}^P] = \frac{\beta_{PP}}{\lambda}$: summarizes impact on MWTT for peer quality among those in treatment group P
- Assumptions for estimation: EVT1 errors and truthful reporting

▶ Evidence on truthful reporting

Information Campaign Effects

- Δ MWTT IA: $\sim -1\text{km}/\text{Decile}$
- Δ MWTT AG: $\sim 0.5\text{km}/\text{Decile}$
- Treatment effects similar for all treatments; mirrors reduced form evidence
- Structural model replicates reduced form effects ▶ Evidence
- Utility weight impacts are a summary measure, nesting both information and salience effects

Motivation
oooooSetting
oooooExperiment Design
ooooooooReduced Form Evidence
oooooSurvey Evidence
ooooDiscrete Choice Evidence
ooo●oooImpacts on Outcomes
ooooConclusion
o

Introducing Imperfect Information

- Define beliefs about Q_j^P and Q_j^S as

$$\tilde{Q}_{ji}^P = (1 + b_{Pi})Q_j^P$$

$$\tilde{Q}_{ji}^S = (1 + b_{Si})Q_j^S$$

where biases b_{Pi} and b_{Si} have mean μ_P and μ_S , respectively

- The biases (b_{Pi}, b_{Si}) are proportional deviations away from the researcher-generated measures

Introducing Imperfect Information

- Define beliefs about Q_j^P and Q_j^S as

$$\tilde{Q}_{ji}^P = (1 + b_{Pi})Q_j^P$$

$$\tilde{Q}_{ji}^S = (1 + b_{Si})Q_j^S$$

where biases b_{Pi} and b_{Si} have mean μ_P and μ_S , respectively

- The biases (b_{Pi}, b_{Si}) are proportional deviations away from the researcher-generated measures
- **Key assumption:** In a model with imperfect information, assume treated parents choose schools with Q_j^P and/or Q_j^S and pure control parents choose with their beliefs

Motivation
oooooSetting
oooooExperiment Design
ooooooooReduced Form Evidence
oooooSurvey Evidence
ooooDiscrete Choice Evidence
oooo●○Impacts on Outcomes
ooooConclusion
o

Decomposing treatment effects

- Interested in decomposing the following estimand:

$$E[\Delta MWTT_i^P] \equiv E[MWTT_{iP}^P - MWTT_{i0}^P]$$

- Observed average MWTT for Q_j^P among those in the pure control group: $E[MWTT_{i0}^P] = \frac{\gamma_P(1+\mu_P)}{\lambda}$
- Observed average MWTT among those receiving treatment P : $E[MWTT_{iP}^P] = \frac{\gamma_P + \beta_{PP}}{\lambda}$
- Therefore,

$$E[\Delta MWTT_i^P] = \frac{\beta_{PP} - \gamma_P \mu_P}{\lambda}$$

Outcomes of Interest

1. Enrollment

→ Previous evidence relates to application behavior but congestion potentially attenuates enrollment impacts

2. Test Scores

→ Observed in eleventh-grade and only available for 2019 cohort

3. Non-cognitive outcomes collected in School Experience Survey

→ Following Jackson et al. 2020, I organize non-cognitive outcome data into five standardized indices (Kling, Liebman, and Katz 2007):

3.1 Happiness

3.2 Interpersonal Skills

3.3 School Connectedness

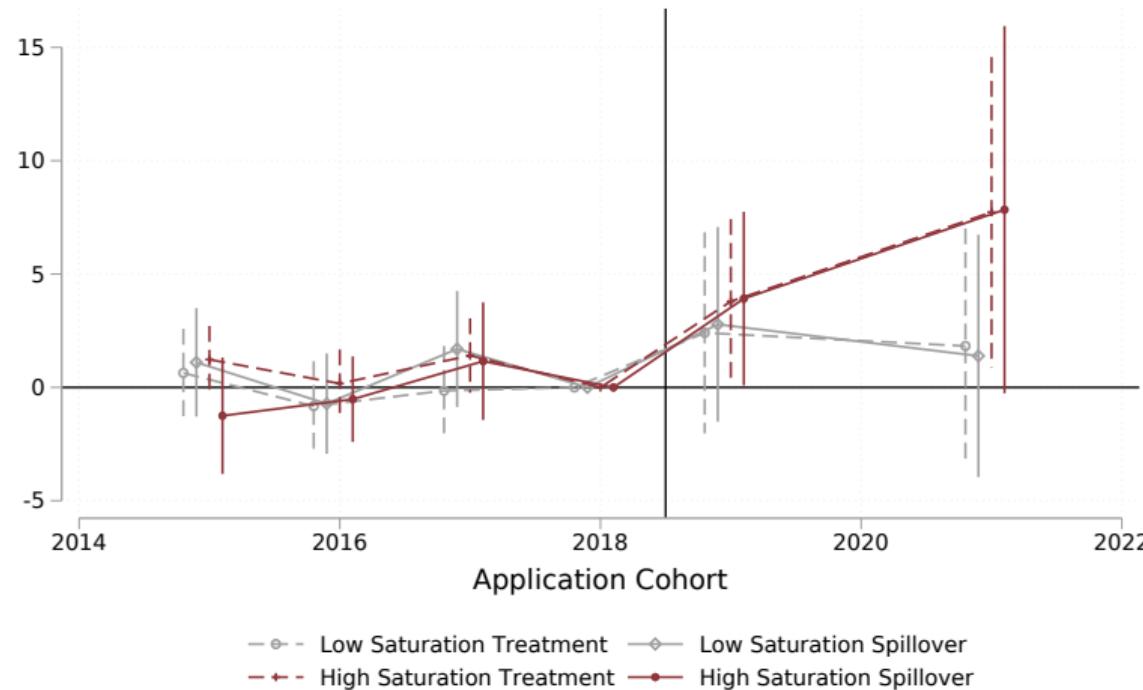

3.4 Academic Effort

3.5 Bullying

Concluding Thoughts

What Parents Know and Value

- What parents know: Parents' bias is not severe on average but there is substantial dispersion in beliefs
- What parents value: Parents respond more to variation and information about school than peer quality
- VA-oriented campaigns have the potential to affect demand for effective schools and school enrollment segregation

Concluding Thoughts

What Parents Know and Value

- What parents know: Parents' bias is not severe on average but there is substantial dispersion in beliefs
- What parents value: Parents respond more to variation and information about school than peer quality
- VA-oriented campaigns have the potential to affect demand for effective schools and school enrollment segregation

Social interactions and their implications

- This paper documents evidence of an externality at the preference formation stage
- Information interventions that encourage social interactions (Banerjee et al. 2022) can potentially address network-based disparities in accessing effective schools

Concluding Thoughts

What Parents Know and Value

- What parents know: Parents' bias is not severe on average but there is substantial dispersion in beliefs
- What parents value: Parents respond more to variation and information about school than peer quality
- VA-oriented campaigns have the potential to affect demand for effective schools and school enrollment segregation

Social interactions and their implications

- This paper documents evidence of an externality at the preference formation stage
- Information interventions that encourage social interactions (Banerjee et al. 2022) can potentially address network-based disparities in accessing effective schools

The role of salience

- Information campaigns potentially operate by addressing information disparities but also by re-orienting demand

We are providing information about schools within your Zone of Choice to ensure you have the best information available prior to your upcoming decision.

Bell Zone of Choice

We determine the quality of a school based on students' average scores on state exams

This measure has two parts you should consider, one which measures the school's ability of attracting high scoring students, and the second is the school's impact on test score growth.

Therefore, a school's observed quality is a combination of both their students' incoming achievement and the achievement growth they obtain while at the school. Some parents may prefer schools with high incoming achievement, and others may prefer schools with high achievement growth. The table below provides each school's district-wide ranking.

We hope you use this information when choosing the right school for your student.

School	Incoming Achievement*	Achievement Growth*	Campus Location	Type of School
Science, Technology, Engineering, Arts & Math (STEAM) High School	76	94	Legacy HS	Small School
Visual & Performing Arts (VAPA) High School	74	67	Legacy HS	Small School
Health Academy	58	58	Elizabeth LC	Small Learning Community
Multilingual Teacher Academy	63	50	Bell HS	Linked Learning Academy
STEAM	47	82	Maywood Academy	Small Learning Community
Information Technology Academy	49	53	Elizabeth LC	Small Learning Community
Arts Language & Performance Humanities Academy	63	50	Bell HS	Linked Learning Academy
9th Grade Academy	47	82	Maywood Academy	Small Learning Community
Bell Global Studies	63	50	Bell HS	Small Learning Community

Incoming Achievement

Incoming achievement is the average test scores of school's incoming students at the time they enter school.

Achievement Growth

We measure a school's ability improve test scores by measuring the growth of their students' test scores between entry into the school and eleventh grade.

Estamos proporcionando información sobre las escuelas dentro de su Zona de Opción, para asegurarnos de que tenga la mejor información disponible antes de su próxima decisión.

Zona de Opción Bell

Determinamos la calidad de una escuela en función de los puntajes promedio de los estudiantes en los exámenes estatales

Esta medida tiene dos partes que debe considerar, una que mide la capacidad de la escuela para atrar a estudiantes con altas calificaciones, y la segunda es el impacto de la escuela en el crecimiento tanto del

Por lo tanto, la calidad observada de una escuela es una combinación tanto del rendimiento entrante de sus estudiantes como del **crecimiento de logros** o crecimiento del rendimiento que obtienen mientras están en la escuela. Algunos padres pueden preferir escuelas con alto rendimiento entrante, y otros pueden preferir escuelas con alto crecimiento de logros. A continuación, proporcionamos la clasificación de cada escuela comparado a todas las escuelas en el distrito.

Esperamos que utilice esta información al elegir la escuela adecuada para su estudiante.

Escuela	Rendimiento Entrante*	Crecimiento de logros*	Ubicación del campus	Tipo de escuela
Preparatoria de Ciencia, Tecnología, Ingeniería, Artes y Matemáticas (STEAM)	76	94	Legacy HS	Escuela Pequeña
Preparatoria de Artes Visuales y Técnicas (VAPA)	74	67	Legacy HS	Escuela Pequeña
Academia de Salud	58	58	Elizabeth LC	Comunidad Educativa Pequeña (SLC)
Academia de Aprendizaje Enlazado/ Carrera de Profesores Multilingües	63	50	Bell HS	Academia de Aprendizaje Enlazado
Academia de Ciencia, Tecnología, Ingeniería, Artes y Matemáticas (STEAM)	47	82	Maywood Academy	Comunidad Educativa Pequeña (SLC)
Academia de Información Técnologica	49	53	Elizabeth LC	Comunidad Educativa Pequeña (SLC)
Academia de Artes, Idiomas, Artes Escénicas y Humanidades	63	50	Bell HS	Academia de Aprendizaje Enlazado
Academia del 9º Grado	47	82	Maywood Academy	Comunidad Educativa Pequeña (SLC)
Estudios Globales	63	50	Bell HS	Comunidad Educativa Pequeña (SLC)

School and Peer Quality Definition

$$Y_{ij} = \mu_j + a_i$$

- Y_{ij} is student i 's potential achievement at school j
- μ_j is school j mean potential outcome
- a_i is mean-zero student ability

School and Peer Quality Definition

$$Y_{ij} = \mu_j + a_i$$

- Y_{ij} is student i 's potential achievement at school j
- μ_j is school j mean potential outcome
- a_i is mean-zero student ability

Estimation and Validation:

$$Y_i = \mu_0 + \sum_j \beta_j D_{ij} + \gamma' X_i + u_i$$

- D_{ij} are school j enrollment indicators; $\beta_j = \mu_j - \mu_0$ is school j average treatment effect

School and Peer Quality Definition

$$E[Y_i | S_i = j] = \underbrace{\beta_j}_{School\ Quality\ Component} + \underbrace{\theta' \bar{X}_j}_{E[a_i | S_i=j]:\ Peer\ Quality\ Component}$$

School and Peer Quality Definition

$$E[Y_i|S_i = j] = \underbrace{\beta_j}_{School\ Quality\ Component} + \underbrace{\theta' \bar{X}_j}_{E[a_i|S_i=j]:\ Peer\ Quality\ Component}$$

- School Quality is referred to as **Achievement Growth** and is defined as

$$Q_j^S = \text{int}\left(\frac{\text{rank}(\hat{\beta}_j)}{J} \times 100\right)$$

- Peer Quality is referred to as **Incoming Achievement** and is defined as

$$Q_j^P = \text{int}\left(\frac{\text{rank}(\hat{\theta}' \bar{X}_j)}{J} \times 100\right)$$

- Peer and school quality are positively correlated

IA-AG Correlation

We are providing information about schools within your Zone of Choice to ensure you have the best information available prior to your upcoming decision.

Bell Zone of Choice

We determine the quality of a school based on students' average scores on state exams

This measure has two parts you should consider, one which measures the school's ability of attracting high scoring students, and the second is the school's impact on test score growth.

Therefore, a school's observed quality is a combination of both their students' incoming achievement and the achievement growth they obtain while at the school. Some parents may prefer schools with high incoming achievement, and others may prefer schools with high achievement growth. The table below provides each school's district-wide ranking.

We hope you use this information when choosing the right school for your student.

School	Incoming Achievement ^a	Achievement Growth ^a	Campus Location	Type of School
Science, Technology, Engineering, Arts & Math (STEAM) High School	76	94	Legacy HS	Small School
Visual & Performing Arts (VAPA) High School	74	67	Legacy HS	Small School
Health Academy	58	58	Elizabeth LC	Small Learning Community
Multilingual Teacher Academy	63	50	Bell HS	Linked Learning Academy
STEAM	47	82	Maywood Academy	Small Learning Community
Information Technology Academy	49	53	Elizabeth LC	Small Learning Community
Arts Language & Performance Humanities Academy	63	50	Bell HS	Linked Learning Academy
9th Grade Academy	47	82	Maywood Academy	Small Learning Community
Bell Global Studies	63	50	Bell HS	Small Learning Community

Incoming Achievement

Incoming achievement is the average test scores of school's incoming students at the time they enter school.

Achievement Growth

We measure a school's ability improve test scores by measuring the growth of their students' test scores between entry into the school and eleventh grade.

Bias by Position of the Rank-Ordered List

- Parents overestimate most-preferred AG and IA by 32 and 13 percent, respectively
- Parents more optimistic about AG than IA across the entire list
- Modest gradient indicating parents are more pessimistic about options they prefer less
